

# **Nutrition-sensitive agricultural diversification and dietary diversity: Panel data evidence from Tajikistan**

**Hiroyuki Takeshima**, *Senior Research Fellow, IFPRI*  
([h.takeshima@cgiar.org](mailto:h.takeshima@cgiar.org), presenter)

**Isabel Lambrecht**, *IFPRI*  
**Kamiljon Akramov**, *IFPRI*

**Tanzila Ergasheva**, *Tajik Academy of Agricultural Sciences*

10th Annual Life in Kyrgyzstan Conference, Bishkek, Kyrgyzstan  
October 9-11, 2024

# Outlines

- **Background**

- Roles of agriculture on nutrition improvement
- Home production of food items within semi-subsistence contexts
- Limited micro-evidence for semi-subsistence households in former socialist countries

- **Objectives:** to assess

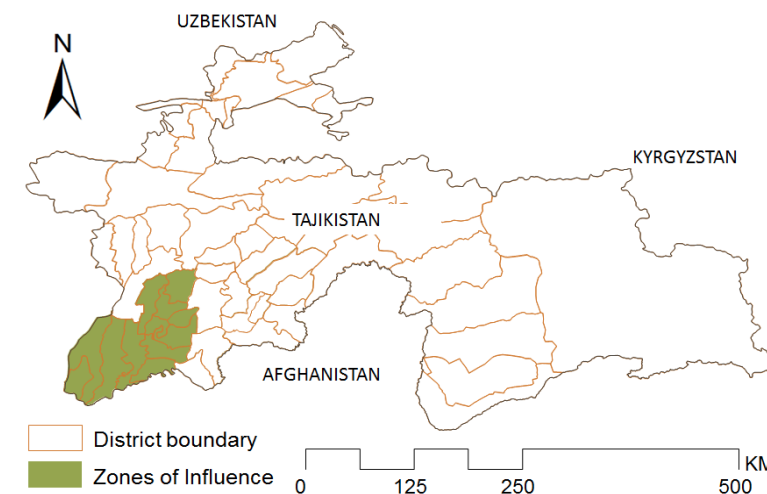

- Linkage between home production on food items and food/nutrition security, poverty reduction among semi-subsistence households in Tajikistan

- **Empirical approach**

- Khatlon province, Tajikistan (agriculture-based, high poverty province)
- Panel data
- Standard model
  - Fixed-effects instrumental variable model
  - Difference-in-difference propensity-score matching (DID-PSM)
- **“Incentive-based model”** within subsistence economy context
  - Lee-Maddala-Björklund-Moffitt (LMBM) model with Correlated Random Effects (LMBM-CRE)

# Survey locations: Khatlon Province, Tajikistan

- 1,598 panel households (2015 / 2023)
- 322 panel women of reproductive age (15-49 years old)
- 12 Raions (districts) from USAID Feed-the-Future (FTF) Zone of Influence
- 2015: USAID FTF Mid-line survey
- 2023: Follow-up survey
- Survey periods: February – March

# Empirical approaches

## A. Associations between *agricultural production practices* and *food/nutrition security, poverty*

### 1. Agricultural production practices

- Diversification
- Land productivity (Yield)
- Labor productivity (Production per capita)

### 2. Methodologies

- a) **Instrumental variable regression**, instrumenting agricultural production practices by
  - Farm size
  - Agricultural capital
- b) **Difference-in-Difference Propensity Score Matching**
  - Binary indicator of various agricultural production practices (below or above sample median)

## B. “Incentive-based model” within subsistence economy context

## B. “Incentive-based model” within subsistence economy context

- Lee (1979) – Maddala (1983) – Björklund & Moffitt (1987) framework
- Revisited by Eisenhauer, Heckman & Vytlacil (2015) for impact evaluation

$$U(Y_{it}^0 + \alpha_{it} - \phi_{it}) > U(Y_{it}^0)$$

$\alpha_{it}$ : benefits  
 $\phi_{it}$ : costs

$$\begin{aligned} Y_{it} &= X_{it}\beta + Z_{it}\delta + CRE_i + \varepsilon_{it} + u_{it} && \text{if } R_{it} = 1 \text{ (Agricultural diversification, land/labor productivity is above sample median)} \\ Y_{it} &= X_{it}\beta + CRE_i + \varepsilon_{it} + u_{it} && \text{if } R_{it} = 0 \end{aligned}$$

$$\begin{aligned} R_{it} &= 1 && \text{if } R_{it}^* > 0; \\ R_{it} &= 0 && \text{otherwise} \end{aligned}$$

$$R_{it}^* = Z_{it}\delta - W_{it}\eta + CRE_i + u_{it} - v_{it}$$

Capture how expected returns induce agricultural intensification (“incentive”)

$$\begin{aligned} \alpha_{it} &= Z_{it}\delta + CRE_i + u_{it} && (\alpha_{it} \text{ is unobserved}) \\ \phi_{it} &= W_{it}\eta + CRE_i + v_{it} && (\phi_{it} \text{ is unobserved}) \end{aligned}$$

Identify factors that affect (unobserved) benefits and costs of adopting particular agricultural production characteristics

Estimate this by Lee (1979)’s “two stage probit analysis” method

# Outcomes and agricultural production characteristics of interests

## Outcomes

Categories	Unit	Measurement
Dietary diversity	Household	12 food groups (7-day recall)
	Women	10 food groups (1-day recall)
Poverty	Household	USD 3.65 per capita per day (constant 2017 USD, PPP)
Household hunger scale	Household	0 = no hunger; 6 = most severe hunger
Subsistence food consumption	Household	Consumption × Imputed price

## Agricultural production characteristics (household level)

Categories	Measurements (household level)
Diversification	Number of food groups produced
Land productivity	Total production value per cultivated area
Labor productivity	Total production value per capita

# Explanatory variables – household level model

Categories	Variables
Household demographics	<ul style="list-style-type: none"> <li>• Age / gender of primary respondent</li> <li>• Household size by age group, gender</li> <li>• Members living away from home for at least 6 months</li> </ul>
Human capital	<ul style="list-style-type: none"> <li>• Education (average among working age household members)</li> </ul>
Agroecological variables	<ul style="list-style-type: none"> <li>• historical temperature, rainfall, soil, hydrological conditions (proximity to the nearest major rivers, groundwater depth), elevation, terrain ruggedness, and the local land-share of pasture</li> </ul>
Wealth	<ul style="list-style-type: none"> <li>• Durable assets</li> <li>• Livestock</li> <li>• Housing conditions (improved materials used for flooring, exterior walls, access to gas for cooking)</li> </ul>
Sanitary and hygienic conditions	<ul style="list-style-type: none"> <li>• Improved sources of drinking water, and improved sanitation system</li> <li>• Garbage collection, disposal systems, centralized sewage system</li> </ul>
Access to markets	<ul style="list-style-type: none"> <li>• Distances to food market (state stores, private store, food market/bazaar, livestock market/bazaar, restaurant, café)</li> </ul>
District (Raion), year dummy	

# Additional explanatory variables – Individual women's model

## Women

Categories	Variables
Demographics	Age of women
Human capital	Education level of women

## Additional explanatory variables: Decomposing unobserved benefits and costs in “Incentive-based model”

Categories	Variables
Factors potentially affecting the benefits but not costs	<ul style="list-style-type: none"><li>• Ownership of fridge, freezer or microwave oven (= affect how the harvested crops are stored and processed effectively)</li><li>• Output price of crops produced</li></ul>
Factors potentially affecting the costs but not benefits	<ul style="list-style-type: none"><li>• farm size</li><li>• agricultural capital</li></ul>

# RESULTS

# Dietary diversity

Outcomes	Ag production practices	Instrumental variable regression		Propensity score matching	
		All	Remote	All	Remote
Household dietary diversity score ( <i>count</i> )	Diversification ( <i>count</i> )	0.258***	1.142**	0.751***	1.112***
	Land productivity ( <i>natural log</i> )	0.772*	1.245**	0.340**	0.525**
	Labor productivity ( <i>natural log</i> )	0.850*	0.096***	0.705***	0.985***
Women's dietary diversity score ( <i>count</i> )	Diversification	0.122**	0.360***	0.206	0.986*
	Land productivity	0.022	0.131***	NA	NA
	Labor productivity	0.031	0.154*	0.537*	1.139**

⇒ Broadly positive linkages between greater diversification, land and labor productivity, and dietary diversity score

⇒ Particularly strong linkages in remote areas

# Poverty, hunger scale, subsistence food consumption

Outcomes	Ag production practices	Instrumental variable regression		Propensity score matching	
		All	Remote	All	Remote
No poverty ( <i>binary</i> )	Diversification ( <i>count</i> )	0.026***	0.023***	0.056*	0.075*
	Land productivity ( <i>natural log</i> )	0.019*	0.032**	0.151***	0.122**
	Labor productivity ( <i>natural log</i> )	0.026**	0.013*	0.054*	0.077**
Less hunger ( <i>reverse of household hunger scale</i> )	Diversification	0.026*	0.551**	0.114*	0.264**
	Land productivity	0.026	0.526*	0.113	0.281*
	Labor productivity	0.026**	0.026**	0.250***	0.307***
Subsistence food consumption ( <i>natural log, standardized</i> )	Diversification	0.672***	0.542**	0.957***	0.994***
	Land productivity	0.892**	0.867**	0.110	0.223*
	Labor productivity	0.823**	0.997**	0.693***	0.700***

⇒ Broadly positive linkages, particularly remote areas

⇒ Key contribution of subsistence consumption of home-produced food items

# Incentive-based model

Key associated factors	Returns from agricultural diversification Returns from women's dietary diversity score		Costs of agricultural diversification
	(including returns on HDDS)	(including returns on WDDS)	
Durable asset	<b>0.115***</b>	−0.004	−0.002
Improved sanitation	<b>−0.520*</b>	<b>−0.073*</b>	−0.032
Garbage collection	−0.163	<b>−0.270**</b>	−0.128
Livestock assets	0.123	−0.064	<b>−0.037**</b>
Distance to food market	<b>0.173*</b>	0.007	<b>0.018***</b>
Farm area with use rights	0.207	−0.116	<b>0.095**</b>
Own refrigerator	<b>0.579*</b>	−0.075	
Inverse Mills ratio	−1.168	<b>0.265**</b>	
Agricultural capital			<b>−0.047**</b>

⇒ (Unobserved) returns from agricultural diversification differ across households and women, given their characteristics

⇒ More agricultural capital lowers (unobserved) costs

	HDDS	WDDS
Returns from agricultural diversification (on dietary diversity)	<b>0.014*</b> (0.008)	<b>0.040**</b> (0.019)

⇒ Higher returns from agricultural diversification induces greater agricultural diversification (i.e., incentive-driven decision on agricultural diversification)

# Dietary diversity and specific food groups (typology)

## Household level

## Individual women level

Major drivers of dietary diversity

## Strong linkages at food-group levels

Outcomes	Ag production practices (whether growing)	Instrumental variable regression		Propensity score matching	
		All	Remote	All	Remote
<b>Household dietary diversity score (count)</b>	Vegetables	−0.024	−0.034	0.009	0.013
	Fruits	<b>0.353***</b>	<b>0.566***</b>	<b>0.090**</b>	<b>0.173***</b>
	Legumes / nuts	<b>0.370*</b>	<b>0.651***</b>	<b>0.230***</b>	<b>0.249***</b>
	Dairy products	<b>0.776***</b>	<b>0.634***</b>	<b>0.572***</b>	<b>0.494***</b>
	Eggs	<b>0.331**</b>	<b>0.863***</b>	<b>0.517***</b>	<b>0.507***</b>
<b>Women's dietary diversity score</b>	Vegetables	0.070	<b>0.311*</b>	0.043	<b>0.265*</b>
	Fruits	0.149	<b>0.878***</b>	<b>0.121**</b>	<b>0.156**</b>
	Legumes / nuts	<b>0.345***</b>	<b>0.308*</b>	0.059	<b>0.680*</b>
	Dairy products	<b>0.879***</b>	<b>0.589**</b>	<b>0.669***</b>	<b>0.466***</b>
	Eggs	−0.221	0.079	<b>0.283*</b>	<b>0.206***</b>

=> Significant linkages between home-production and consumption at food group levels

# Conclusions

- In Khatlon province, Tajikistan, home-production of food item remains important for dietary diversity (household level as well as for individual women of reproductive age)
  - Diversification, land and labor productivity growth in food production
- Home production of food items also beneficial in poverty / hunger reduction
- Potential returns to home production of food items, which are unobserved, vary across households
- Higher returns incentivize households to extend agricultural diversification
  - => Incentive-based decision-making important for semisubsistence households in former socialist countries
- Improved knowledge on the benefits of dietary diversity potentially important for stimulating agricultural diversification and productivity growth among these households

**Thank you !**
